SUBMITTED BY->SHYAMA(2021492),

SHIVAM(2021489)

In this deadline ,we have implemented the queries using the python+mysql connector(which is used for connecting our database named "shivam")

OLAP queries we have implemented->

We have used the rollup with olap query,aggregate functions with group by having for properly organising,grouping the data from the database.

We have used 2 triggers -> one for our feedback table and other one for transaction.

1) We are checking the rating in our feedback table(1-10)if user enters anything other than this,it will show not a valid rating!!
2) For the transaction table,if a user tries to enter an amount less than 5,then it would set the amount to 5 .Transactio of amount less than 5 wont be possible.
